

DermaSweep MD

This revolutionary system, available only to licensed medical practitioners, combines precision brush tip exfoliation, topical solutions and variable vacuum pressure for the most precise, efficacious and comfortable skin treatments available.

DermaSweep features a closed system with a variable level vacuum pump that gently lifts the skin as our bristles "sweep away" the dead layer of skin in a precise and controlled manner. Our patent pending bristle tips fully eliminate the mess and hazards associated with traditional crystal systems.

Further, these polyester or nylon bristles prevent the build up of keratin on the wand that has been a problem with other particle-free systems. DermaSweep enables airflow through the bristles to allow the skin to be gently drawn into the bristle for a more effective and less irritating exfoliation. Our innovative, efficient use of vacuum pressure and bristles are then customized for each treatment depending on skin type, desired level of exfoliation and results.

DermaSweep results in a clean, consistently effective treatment and patients see a noticeable skin improvement with fewer treatments and improved results even with the first treatment.

In one single system, the DermaSweep MD 6000 delivers technology advancements in each of its three levels of skin resurfacing:

- Particle-free Microdermabrasion for exfoliation of the epidermis.
- Epi-Infusion for simultaneous microdermabrasion with our trademarked topical solution delivery. Epi-Infusion delivery combines therapy using our precision bristle combinations with simultaneous topical delivery of the physician's choice of appropriate solution. It is safe and painless.
- Hydro-Assisted Dermabrasion for the deepest penetrating dermabrasion. Hydro-Assisted dermabrasion delivers the greatest level of vacuum pressure and is combined with the most abrasive tips for the deepest treatment available.
